NGO TUNG ANH

FULLSTACK DEVELOPER

Ha Noi, Viet Nam | 0382584407 | tunganhngo207@gmail.com | github.com/DawnBreaker207

ABOUT ME

Backend-focused developer with 2 years of production experience across a Japanese healthcare system (FPT Software) and a national business registration platform (AtwoM Vietnam). Comfortable working in distributed systems — implemented Saga/Outbox patterns, Redis Pub/Sub seat locking, and Circuit Breaker in real client projects. Looking for a backend or fullstack role where system design and reliability matter.

SKILL & BACKGROUND KNOWLEDGE

Backend: Java 17, Spring Boot (REST, Spring Security, Spring Data JPA/Hibernate, Spring Cloud), Microservices, Modular Monolith, JWT, RabbitMQ

Databases & Caching: MySQL, PostgreSQL, Redis, Flyway

DevOps & Infrastructure: Docker, GitHub Actions (CI/CD), Nginx, Cloudflare

Testing: JUnit, Mockito

AI-Assisted Development: AI Coding Agents (OpenCode, Antigravity CLI, Cursor), AGENTS.md (agent context), MCP

Frontend: TypeScript, Angular (RxJS, NgRx), React (Redux, Tailwind CSS)

Tools: Git, Jira, DBeaver, Maven, Postman

Software Process: Agile/Scrum, GitFlow, code review

Languages: English (reading & writing)

WORK EXPERIENCE

Fullstack Developer | AtwoM Vietnam | (2/2026 - 9/2026)

National Startup Business Registration Platform *| Spring Boot, Spring Cloud, RabbitMQ, React, PostgreSQL*

- Worked on an early-stage platform where startups can register, go through an approval and valuation process, and get listed for potential acquisition. The system is built on a **microservices** architecture with an **API Gateway**, service discovery and event-driven messaging via **RabbitMQ**.
- Developed responsive frontend interfaces in React with **Redux**, engineering a multi-step startup application form with client-side validation and seamless API Gateway integration.
- Contributed to a shared login and permission service that the whole system relies on. Instead of each service handling its own auth, everything goes through one place, which keeps access control consistent across the platform.
- Built out the personal information module, where users can manage their own profile data, using Spring Boot and PostgreSQL.
- Followed an **Agile/Scrum** workflow (**Jira**, GitFlow, pull request reviews) with **AI coding agents** integrated into development, and reviewed and tested all generated code before merging.

Fullstack Developer | FPT Software | (8/2024 - 1/2026)

Healthcare Management System (Japan Client) *| Spring Boot, Angular, NgRx, RxJS, SQL Server, RabbitMQ*

- Worked on a large-scale pharmacy system for a Japanese client, built on a **microservice** architecture with Spring Boot backends, **RabbitMQ** for async messaging, and a monorepo **Angular** frontend split into domain workspaces.
- Took on legacy migration work on the backend by reading through old code, understanding the business rules, then rewriting them into the new Spring Boot modules. Fixed bugs, resolved data mapping issues, and kept services consistent with team conventions along the way.
- Worked with the team to implement distributed transaction handling using **Saga** and **Outbox** patterns, and helped set up **Circuit Breaker** for fault tolerance on critical prescription flows.
- Built prescription workflow screens in Angular with per-feature **NgRx** stores. Used **RxJS** Effects to chain API calls and keep UI state accurate at each step, especially for the safety check screen where showing "still checking" vs "check failed" clearly matters before a pharmacist can proceed.
- Worked in a 10-person squad using **Agile**, tickets via **Jira**, code review before every merge, two-week sprints.

PROJECTS

CINEPLEX *| (6/2025 - 6/2026)*

Movie Reservation System */ Tech stack: Spring Boot, MySQL, Redis, Angular, Ng-Zorro, NgRx*

- Designed a **modular monolith** with isolated domain modules (booking, cinema, identity, catalog) sharing a common infrastructure module.
- Prevented double-booking with **Redis** TTL **seat locks**, and pushed real-time seat status to all users via **Redis Pub/Sub** and **SSE**.
- Implemented **JWT** authentication with refresh token rotation, invalidating prior tokens on refresh.
- Offloaded **PDF report** generation and confirmation emails to **RabbitMQ** workers to keep checkout fast.
- Built an admin dashboard with **JasperReports** export and integrated the **VNPay** sandbox gateway.
- Wrote unit tests with **JUnit** and **Mockito** for the booking and authentication logic.
- Automated builds and deployments via Docker and GitHub Actions CI/CD behind an Nginx reverse proxy and Cloudflare Tunnel.

EDUCATION

University of Transport and Communications (UTC) — Bachelor of Information Technology
